

BPL implementation, as currently designed, will radiate RF signals across a wide slice of the radio spectrum and be intercepted by many different types of receivers...not just those designed to extract the "Internet connection". Has this service been engineered so that there is no interference to devices that have been purchased, and are being used, by consumers in the pursuit of their daily activities. The RF spectrum, like the air we breathe, should be available for all to use/enjoy...and not be a profit seeking venue for a few.
